We want to know the value of these functions when $t = 5$. Using Euler's method and $\Delta t = 1$ we get the result that $x(5) \approx 14.2$ and $y(5) \approx 23.8$. Next, we use Euler's method again with $\Delta t = 0.5$ and find that $x(5) \approx 14.6$ and $y(5) \approx 5.3$. Finally we use $\Delta t = 0.25$, finding that $x(5) \approx 14.8$ and $y(5) \approx -3.7$. What does this mean?
- (a) Fewer steps means fewer opportunities for error, so $(x(5), y(5)) \approx (14.2, 23.8)$.
 (b) Smaller stepsize means smaller errors, so $(x(5), y(5)) \approx (14.8, -3.7)$.
 (c) We have no way of knowing whether any of these estimates is anywhere close to the true values of $(x(5), y(5))$.
 (d) At these step sizes we can conclude that $x(5) \approx 15$, but we can only conclude that $y(5) < -3.7$.
 (e) Results like this are impossible: We must have made an error in our calculations.
